

AMRtime

Precise identification of antimicrobial resistance determinants
from metagenomic data

3. Filtering out non-AMR reads
4. Sensitive Homology Classification

Background

AMR-metagenomics

Comprehensive Antibiotic Resistance Database

cmlA1

[Download Sequences](#)

Accession	ARO:3002693
Definition	cmlA1 is a plasmid or transposon-encoded chloramphenicol exporter that is found in <i>Pseudomonas aeruginosa</i> and <i>Klebsiella pneumoniae</i>
AMR Gene Family	major facilitator superfamily (MFS) antibiotic efflux pump
Drug Class	phenicol antibiotic
Resistance Mechanism	antibiotic efflux
Efflux Component	efflux pump complex or subunit conferring antibiotic resistance
Classification	7 ontology terms Hide + process or component of antibiotic biology or chemistry + mechanism of antibiotic resistance + determinant of antibiotic resistance + antibiotic molecule + antibiotic efflux [Resistance Mechanism] + phenicol antibiotic [Drug Class] + efflux pump complex or subunit conferring antibiotic resistance [Efflux Component]
Parent Term(s)	2 ontology terms Hide + major facilitator superfamily (MFS) antibiotic efflux pump [AMR Gene Family] + confers_resistance_to_drug chloramphenicol [Antibiotic]
Publications	Bissonnette L, et al. 1991. J Bacteriol 173(14): 4493-4502. Characterization of

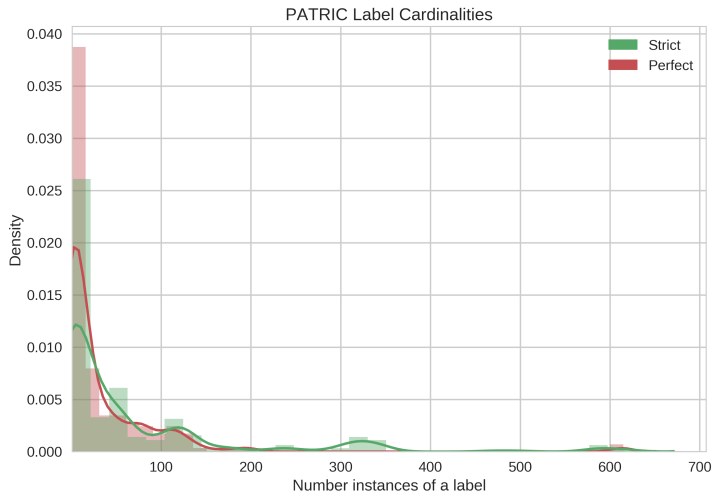

Why is AMR metagenomics difficult?

AMR genes are rare genomically

2184 CARD-Prevalence Genomes at 1-10X abundance

AMR genes have wildly different abundances

1236 AMR PATRIC genomes

AMR sequence space overlaps

- No point doing what we do if people can't use it.
- Limited hardware requirements (a standard workstation or instance $< 8 - 12\text{Gb}$, $1 - 8$ cores).
- Fast enough (< 12 hours).
- Easy to install/configure.
- Easy to use.
- Easy to update.

AMRtime Overview

AMRtime structure

AMRtime structure

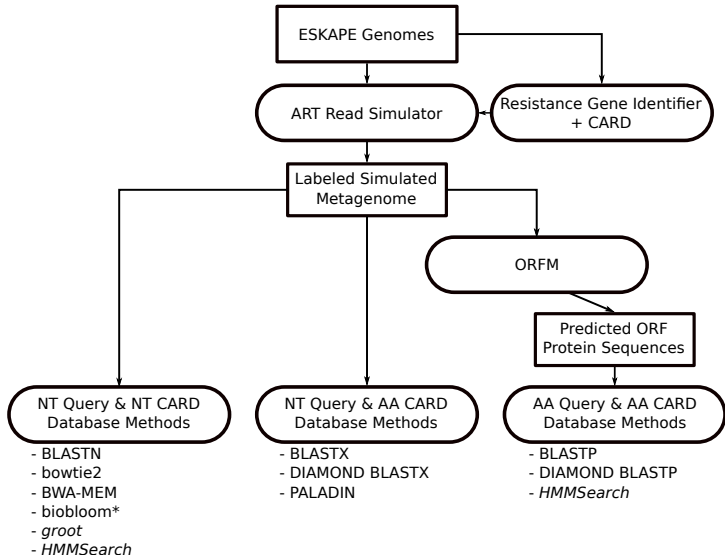

AMRtime structure

Filtering out non-AMR reads

Testing sequence similarity search tools

Terminology refresher interlude

How many selected items are relevant?

$$\text{Precision} = \frac{\text{true positives}}{\text{true positives} + \text{false positives}}$$

How many relevant items are selected?

$$\text{Recall} = \frac{\text{true positives}}{\text{true positives} + \text{false negatives}}$$

<https://commons.wikimedia.org/wiki/File:Precisionrecall.svg>

DNA subject best for precision, Protein subject best for recall

Simulated MiSeq v3 250bp reads, 30.31M reads (7.21M AMR derived)

K-mer methods perform poorly

BWT: bowtie2, bwa-mem, paladin; **BLAST:** blast, diamond; **HMM:** hmmsearch; **K-MER:** biobloom, groot.

DIAMOND-BLASTX best compromise

DIAMOND-BLASTX 'more sensitive' setting ($\text{min} < 1e^{-10}$): 4.926 hours with 2 cores and 8.3Gb of memory. AMR Reads: 7.15M detected, 59.26K missed, 1.87M false positives.

Why not just use these sequence searches?

Poor gene-level accuracy

Performance at optimal settings for ARO accuracy

Good family-level accuracy

Performance at optimal settings for Family accuracy

Sensitive Homology Classification

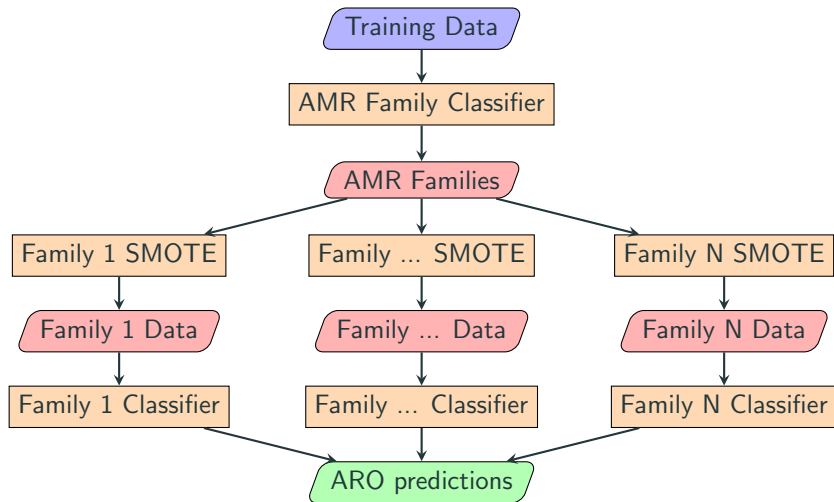

NB 7-mer Average Precision: 0.63

NB 7-mer Average Precision: 0.63 %

Revised classifier structure: exploiting the ARO

Read encoding

Sequence bitscore matrix =

$$\begin{matrix} & \begin{matrix} gene_1 & gene_2 & \dots & gene_{j-1} & gene_j \end{matrix} \\ \begin{matrix} read_1 \\ read_2 \\ \dots \\ read_{i-1} \\ read_i \end{matrix} & \begin{pmatrix} 1256 & 0 & \dots & 0 & 63 \\ 0 & 0 & \dots & 0 & 0 \\ \dots & \dots & \dots & \dots & \dots \\ 0 & 512 & \dots & 0 & 0 \\ 0 & 0 & \dots & 785 & 129 \end{pmatrix} \end{matrix}$$

Advantages: read length invariant, low dimensionality, uses filtering data

Held-out test results

Mean Precision: 0.995, Mean Recall: 0.985

ARO level classification more variable

- Soft-threshold (i.e. propagating probabilities through layers)
- Multiset labels based on sequence redundancy within families.
- Threshold identification for variant model counts.
- Metamodel rule parsing.
- Galaxy bindings (CARD/IRIDA integration).

Summary

- Direct homology searches are surprisingly poor for AMR metagenomics.

Conclusions

- Direct homology searches are surprisingly poor for AMR metagenomics.
- K-mer based approaches fall flat with sequencing error, low coverage and sparse labels.

Conclusions

- Direct homology searches are surprisingly poor for AMR metagenomics.
- K-mer based approaches fall flat with sequencing error, low coverage and sparse labels.
- Direct homology search results ARE useful when combined with machine learning.

Conclusions

- Direct homology searches are surprisingly poor for AMR metagenomics.
- K-mer based approaches fall flat with sequencing error, low coverage and sparse labels.
- Direct homology search results ARE useful when combined with machine learning.
- The Antibiotic Resistance Ontology provides useful structure to improve predictions.

Conclusions

- Direct homology searches are surprisingly poor for AMR metagenomics.
- K-mer based approaches fall flat with sequencing error, low coverage and sparse labels.
- Direct homology search results ARE useful when combined with machine learning.
- The Antibiotic Resistance Ontology provides useful structure to improve predictions.
- AMRtime: coming soon to CARD and your local government genomic epidemiology platform.
